Read the following passage and answer the questions 97 & 98:

Nitrogen is the most common substance in Earth's atmosphere. Liquid nitrogen looks like water, but it acts very differently. It disappears as soon as it touches the floor because it rapidly boils and changes back to a gas at room temperature. A flower dipped in liquid nitrogen will shatter because all of the water in the flower freezes instantly. An inflated balloon placed in liquid nitrogen will appear to slowly deflate. The air isn't leaving the balloon, though. It's just taking up less space because it's getting cold and its particles are moving slower. Once the balloon is removed from the liquid nitrogen, it warms back up and returns to normal. Although experimenting with liquid nitrogen is fun, we still need to be careful with it. We always need to protect our eyes by wearing goggles and our hands by wearing gloves. After all, we wouldn't want to freeze and shatter like a flower!

97. Liquid nitrogen does not exist at room temperature as
A) The boiling point of nitrogen is greater than room temperature.
B) The boiling point of nitrogen is less than room temperature.
